PROFESSIONAL SUMMARY

Cybersecurity student (B.S. Information Technology, GPA 4.0, graduating May 2028) seeking a Summer 2027 offensive security or red team internship. Vulnerability Assessment Team intern at DHS (CBP); CompTIA Security+ and AWS Certified Cloud Practitioner; working toward OSCP. Builds tools for attack emulation, detection-gap measurement, injection-flow analysis and fuzzing.

CORE COMPETENCIES

Python • Rust • Go; C for the fuzzing harness • MITRE ATT&CK • Atomic Red Team • Stratus Red Team (replayed logs) • taint analysis / SAST • OWASP Top 10 • Sigma • vulnerability management (Nessus/Tenable) • CISA KEV / EPSS / CVSS • AWS fundamentals • Docker • GitHub Actions • Git • pytest • Wireshark • Linux • Power BI

CERTIFICATIONS

Certifications: CompTIA Security+ | AWS Certified Cloud Practitioner
In progress: OSCP | AWS Certified Security – Specialty
Work authorization: U.S. Citizen

PROFESSIONAL EXPERIENCE

Vulnerability Assessment Team Analyst Intern | Dept. of Homeland Security (CBP) | Ashburn, VA | May 2026 – Aug 2026

- Matched Nessus/Tenable scan results against the CISA Known Exploited Vulnerabilities (KEV) catalog to find high-risk systems and aged findings.
- Designed a risk-based prioritization method weighing KEV status, asset criticality, exposure, EPSS and CVSS, and benchmarked remediation against CISA BOD 26-04 timelines.
- Built a multi-page Power BI dashboard and an executive briefing on actively exploited vulnerabilities and mitigations for technical and leadership audiences.
- Wrote compliance reports and remediation recommendations aligned with NIST CSF and FedRAMP.

PROJECTS

vulnlab — Localhost web-vulnerability lab (Python, Flask)

- Three small intentionally vulnerable services (SSRF through a redirect, SQL injection in ORDER BY, IDOR), each with a test that shows the impact on loopback only, the fix, and a regression test that fails against the vulnerable version.
- Ran its own analyzer on every version (flags SSRF and SQL injection, false-positives on both fixes, misses the IDOR) and wrote a Sigma detection per bug class.

tripline — ATT&CK emulation and detection-gap measurement (Python)

- Runs Atomic Red Team emulations on Linux and Windows CI runners (and replays public AWS CloudTrail logs) across 14 ATT&CK techniques, including setuid privilege escalation (T1548.001), LSASS credential dumping (T1003.001) and cron persistence (T1053.003).
- Measured what defenders miss: the stock SigmaHQ setuid/setgid rule flagged neither recorded attack event and 0 of 108 generated variants (octal modes, clustered flags, full paths); a replacement rule catches 106. Across 251 variants of three Linux attacks the expected rules catch 200.

sinkline — Finds exploitable injection flows in Python web apps

- Static analyzer that traces attacker-controlled request data to sinks across files and flags SQL and command injection, SSRF, deserialization, XSS, path traversal and XXE, each with its source-to-sink path and OWASP/CWE mapping.
- Independent OWASP BenchmarkPython check (own scoring script): +0.52 true-positive minus false-positive rate on the 10 taint categories vs. Bandit +0.07 and Semgrep +0.04; +0.27 vs. Bandit +0.36 across all 14.

fuzzdiff — Differential fuzzing of a C HTTP parser against a Rust port (Rust, C)

- Rewrote picohttpparser (715 lines of C) in safe Rust and built a harness that runs both on the same input and classifies every difference; libFuzzer targets with ASan and UBSan, Miri and a three-way comparison against httparse run in CI.
- Tested the harness itself by seeding 5 bugs into the Rust port: all 5 detected (3 to 10,085 inputs). 27.6M generated inputs and short CI fuzz runs found no divergence, which the repo states as limited evidence.

EDUCATION

Bachelor of Science, Information Technology | Minor: Cybersecurity
George Mason University | Expected May 2028 | GPA: 4.0

Associate of Science, Information Technology
Northern Virginia Community College | May 2026 | GPA: 3.7
